

An Unofficial Compendium of Worked Solutions to the Problems in *Geometry*

by I. M. Gelfand & T. Alekseyevskaya (Gelfand)

Deepak Venkatesh

September 6, 2026

Abstract

This book is an independent and unofficial collection of worked solutions to problems inspired by the book *Geometry* by I. M. Gelfand and T. Alekseyevskaya (Gelfand), first published in 2020.

The original text presents a wide range of problems in projective geometry, affine geometry, symplectic geometry, and Euclidean geometry. The book contains solved exercises and questions, but the reader is also given 230 problems to solve.

The aim of this book is to provide clear, logically consistent solutions to all of the 230 unsolved problems addressed, written in a style accessible to motivated students and self-learners.

Figures are either drawn by hand and scanned, constructed using GeoGebra, or produced directly in L^AT_EX. Where applicable, proofs or calculations may also be checked using computer programs written in Scheme (a dialect of Lisp) or Python.

Large language models were used only as auxiliary tools, primarily for generating figures in L^AT_EX and for reviewing exposition.

This work is not affiliated with, endorsed by, or approved by the original authors or publisher. Any errors, omissions, or inconsistencies are entirely my own.

Issues and corrections may be reported at the [project repository](#).

Working Notes	7
Introduction	8
 Part I: Points and Lines: A Look at Projective Geometry	 9
Chapter 1: Points and lines	10
Chapter 2: Two lines and an angle	13
Chapter 3: Three lines	14
Chapter 4: Four lines. Quadrilaterals	15
Chapter 5: Five lines	16
Chapter 6: Projection from a point onto a line	17
Chapter 7: Dual configurations in projective geometry	18
Chapter 8: Desargues configuration	19
Chapter 9: Dual Desargues configuration	20
Chapter 10: Algebraic notation of “computer presentation” of configurations	21
Chapter 11: Polygons and n straight lines	22
Chapter 12: Convex polygons, convex hull of n points	23
Chapter 13: Solution of Exercise 3 with the help of a Desargues configuration	24
Chapter 14: Overview of Chapter I	25
 Part II: Parallel Lines: A Look at Affine Geometry	 26
 Part I: Lines and Segments	 27
Chapter 1: Parallel Straight Lines	28
Chapter 2: Operations available in Chapter II	29
Chapter 3: Properties of parallel lines	30
Chapter 4: Segments lying on parallel lines	31
 Part II: Figures	 32

Chapter 5: Parallelograms	33
Chapter 6: Triangles	34
Chapter 7: Trapezoids	35
Part III: Operations with Figures	36
Chapter 8: The Minkowsky addition of two figures	37
Chapter 9: Parallel projection	38
Chapter 10: Parallel translation	39
Chapter 11: Central symmetry on the plane	40
Chapter 12: Vectors	41
Chapter 13: Overview of Chapter II	42
Appendix for Chapter II	43
1. Why we cannot define equal segments in Chapter II	43
2. Parallel lines, equal segments, and the Desargues configuration . . .	43
3. Arithmetic operations with segments	43
4. Segments and rational numbers	43
5. Affine coordinate systems on the plane	43
Part III: Area: A Look at Symplectic Geometry	44
Chapter 1: The area of a figure	45
Chapter 2: Area of a parallelogram	46
Chapter 3: Area of a triangle	47
Chapter 4: Area of a trapezoid	48
Chapter 5: Area of a polygon	49
Chapter 6: More problems on areas	50
Chapter 7: How to measure the area of a figure	51
Chapter 8: Overview of Chapter III	52
Part IV: Circles: A Look at Euclidean Geometry	53
Part I: Introduction to the Circle	54
Chapter 1: Operations available in Chapter IV	55

Chapter 2: Comparing segments	56
Chapter 3: Angles	57
Chapter 4: Operations with figures	58
Part II: The Geometry of the Triangle and Other Figures	59
Chapter 5: Elements of triangle. Congruent triangles	60
Chapter 6: Construction of a triangle from its elements	61
Chapter 7: Relations between elements of a triangle	62
Chapter 8: Properties of a triangle. Particular kinds of triangles	63
Chapter 9: Area in Euclidean geometry	64
Chapter 10: The Pythagorean theorem and its applications	65
Chapter 11: Relations between lines and points	66
Chapter 12: Special lines and special points in a triangle	67
Chapter 13: Polygons	68
Chapter 14: Summary of facts about different quadrilaterals	69
Chapter 15: Similarity	70
Part III: Circles	71
Chapter 16: Circles and points	72
Chapter 17: Circles and lines	73
Chapter 18: Two or more circles	74
Chapter 19: Circles and angles	75
Chapter 20: A circle and a triangle	76
Chapter 21: Circles and polygons	77
Chapter 22: Circumference and arc	78
Chapter 23: Disks and sectors	79
Chapter 24: Overview of Chapter IV	80

Working Notes

Challenging Problems for Middle Schoolers:

Typographical Errors:

1. The standard mathematical spelling of Hermann Minkowski's name is *Minkowski* and not *Minkowsky*.

Introduction

No problems in this chapter.

Part I

Points and Lines: A Look at Projective Geometry

Chapter 1. Points and lines

Problem 1.

In a line if we place a point we divide it into 2 parts. In this case both the part are *rays* and the point is an *endpoint*.

Now if there are 2 point on the line, we still have 2 rays but the two endpoints create a line segment.

So n points on a line will give 2 rays and $(n - 1)$ line segments.

For this problem.

$$\begin{aligned} n &= 100 \\ \text{endpoints} &= 100 \\ \text{rays} &= 2 \\ \text{segments} &= 100 - 1 = 99 \end{aligned}$$

Problem 2.

Three possibilities exist:

1. The two lines A and B can perfectly coincide.
2. They can be parallel to each other.
3. They can intersect at some point.

Basis the figure below the plane can be divided into 2, 3, or 4 parts.

Problem 3.

The chapter explains that geometric constructions performed using the two axioms below are call constructions in *projective geometry*.

Axiom 1: Through any two points, one can draw a unique line.

Axiom 2: Any two lines either have a unique point of intersection or do not intersect (are parallel).

Basis these two axioms of projective geometry we can construct the line AC .

Problem 4.

F and G can be connected with a line since basis Axiom 1 of Projective Geometry we can construct a line. This line intersects at a unique point H with the line e . If e was parallel to line GF then they would never intersect. But given the visual in the problem we are assuming that they will intersect.

Problem 5.

Chapter 2. Two lines and an angle

Chapter 3. Three lines

Chapter 4. Four lines. Quadrilaterals

Chapter 5. Five lines

Chapter 6. Projection from a point onto a line

Chapter 7. Dual configurations in projective geometry

Chapter 8. Desargues configuration

Chapter 9. Dual Desargues configuration

Chapter 10. Algebraic notation of “computer presentation” of configurations

Chapter 11. Polygons and n straight lines

Chapter 12. Convex polygons, convex hull of n points

Chapter 13. Solution of Exercise 3 with the help of a Desargues configuration

Chapter 14. Overview of Chapter I

Part II

Parallel Lines: A Look at Affine Geometry

Part I

Lines and Segments

Chapter 1. Parallel Straight Lines

Chapter 2. Operations available in Chapter II

Chapter 3. Properties of parallel lines

Chapter 4. Segments lying on parallel lines

Part II

Figures

Chapter 5. Parallelograms

Chapter 6. Triangles

Chapter 7. Trapezoids

Part III

Operations with Figures

Chapter 8. The Minkowsky addition of two figures

Chapter 9. Parallel projection

Chapter 10. Parallel translation

Chapter 11. Central symmetry on the plane

Chapter 12. Vectors

Chapter 13. Overview of Chapter II

Appendix for Chapter II

1. Why we cannot define equal segments in Chapter II
2. Parallel lines, equal segments, and the Desargues configuration
3. Arithmetic operations with segments
4. Segments and rational numbers
5. Affine coordinate systems on the plane

Part III

Area: A Look at Symplectic Geometry

Chapter 1. The area of a figure

Chapter 2. Area of a parallelogram

Chapter 3. Area of a triangle

Chapter 4. Area of a trapezoid

Chapter 5. Area of a polygon

Chapter 6. More problems on areas

Chapter 7. How to measure the area of a figure

Chapter 8. Overview of Chapter III

Part IV

Circles: A Look at Euclidean Geometry

Part I

Introduction to the Circle

Chapter 1. Operations available in Chapter IV

Chapter 2. Comparing segments

Chapter 3. Angles

Chapter 4. Operations with figures

Part II

**The Geometry of the Triangle and
Other Figures**

Chapter 5. Elements of triangle. Congruent triangles

Chapter 6. Construction of a triangle from its elements

Chapter 7. Relations between elements of a triangle

Chapter 8. Properties of a triangle. Particular kinds of triangles

Chapter 9. Area in Euclidean geometry

Chapter 10. The Pythagorean theorem and its applications

Chapter 11. Relations between lines and points

Chapter 12. Special lines and special points in a triangle

Chapter 13. Polygons

Chapter 14. Summary of facts about different quadrilaterals

Chapter 15. Similarity

Part III

Circles

Chapter 16. Circles and points

Chapter 17. Circles and lines

Chapter 18. Two or more circles

Chapter 19. Circles and angles

Chapter 20. A circle and a triangle

Chapter 21. Circles and polygons

Chapter 22. Circumference and arc

Chapter 23. Disks and sectors

Chapter 24. Overview of Chapter IV
