

An Unofficial Compendium of Worked Solutions to the Problems in *Geometry*

by I. M. Gelfand & T. Alekseyevskaya (Gelfand)

Deepak Venkatesh

September 8, 2026

Abstract

This book is an independent and unofficial collection of worked solutions to problems inspired by the book *Geometry* by I. M. Gelfand and T. Alekseyevskaya (Gelfand), first published in 2020.

The original text presents a wide range of problems in projective geometry, affine geometry, symplectic geometry, and Euclidean geometry. The book contains solved exercises and questions, but the reader is also given 230 problems to solve.

The aim of this book is to provide clear, logically consistent solutions to all of the 230 unsolved problems addressed, written in a style accessible to motivated students and self-learners.

Figures are either drawn by hand and scanned, constructed using GeoGebra, or produced directly in $\text{\LaTeX}$. Where applicable, proofs or calculations may also be checked using computer programs written in Scheme (a dialect of Lisp) or Python.

Large language models were used only as auxiliary tools, primarily for generating figures in $\text{\LaTeX}$ and for reviewing exposition.

Chapter 10: Parallel translation	41
Chapter 11: Central symmetry on the plane	42
Chapter 12: Vectors	43
Chapter 13: Overview of Chapter II	44
Appendix for Chapter II	45
1. Why we cannot define equal segments in Chapter II	45
2. Parallel lines, equal segments, and the Desargues configuration	45
3. Arithmetic operations with segments	45
4. Segments and rational numbers	45
5. Affine coordinate systems on the plane	45
Part III: Area: A Look at Symplectic Geometry	46
Chapter 1: The area of a figure	47
Chapter 2: Area of a parallelogram	48
Chapter 3: Area of a triangle	49
Chapter 4: Area of a trapezoid	50
Chapter 5: Area of a polygon	51
Chapter 6: More problems on areas	52
Chapter 7: How to measure the area of a figure	53
Chapter 8: Overview of Chapter III	54
Part IV: Circles: A Look at Euclidean Geometry	55
Part I: Introduction to the Circle	56
Chapter 1: Operations available in Chapter IV	57

Chapter 2: Comparing segments	58
Chapter 3: Angles	59
Chapter 4: Operations with figures	60
Part II: The Geometry of the Triangle and Other Figures	61
Chapter 5: Elements of triangle. Congruent triangles	62
Chapter 6: Construction of a triangle from its elements	63
Chapter 7: Relations between elements of a triangle	64
Chapter 8: Properties of a triangle. Particular kinds of triangles	65
Chapter 9: Area in Euclidean geometry	66
Chapter 10: The Pythagorean theorem and its applications	67
Chapter 11: Relations between lines and points	68
Chapter 12: Special lines and special points in a triangle	69
Chapter 13: Polygons	70
Chapter 14: Summary of facts about different quadrilaterals	71
Chapter 15: Similarity	72
Part III: Circles	73
Chapter 16: Circles and points	74
Chapter 17: Circles and lines	75
Chapter 18: Two or more circles	76
Chapter 19: Circles and angles	77
Chapter 20: A circle and a triangle	78
Chapter 21: Circles and polygons	79
Chapter 22: Circumference and arc	80
Chapter 23: Disks and sectors	81
Chapter 24: Overview of Chapter IV	82

Working Notes

Challenging Problems for Middle Schoolers:

- Part I - Chapter 2 - Problem 7
- Part I - Chapter 2 - Problem 8

Typographical Errors:

1. The standard mathematical spelling of Hermann Minkowski's name is *Minkowski* and not *Minkowsky*.

Introduction

No problems in this chapter.

Part I

Points and Lines: A Look at Projective Geometry

Chapter 1. Points and lines

Problem 1.

In a line if we place a point we divide it into 2 parts. In this case both the part are *rays* and the point is an *endpoint*.

Now if there are 2 point on the line, we still have 2 rays but the two endpoints create a line segment.

So n points on a line will give 2 rays and $(n - 1)$ line segments.

For this problem.

$$\begin{aligned} n &= 100 \\ \text{endpoints} &= 100 \\ \text{rays} &= 2 \\ \text{segments} &= 100 - 1 = 99 \end{aligned}$$

Problem 2.

Three possibilities exist:

1. The two lines A and B can perfectly coincide.
2. They can be parallel to each other.
3. They can intersect at some point.

Basis the figure below the plane can be divided into 2, 3, or 4 parts.

Problem 3.

The chapter explains that geometric constructions performed using the two axioms below are call constructions in *projective geometry*.

Axiom 1: Through any two points, one can draw a unique line.

Axiom 2: Any two lines either have a unique point of intersection or do not intersect (are parallel).

Basis these two axioms of projective geometry we can construct the line AC .

Problem 4.

F and G can be connected with a line since basis Axiom 1 of Projective Geometry we can construct a line. This line intersects at a unique point H with the line e . If e was parallel to line GF then they would never intersect. But given the visual in the problem we are assuming that they will intersect.

Problem 5.

There are 8 angles in this. From one side of the ray of b to one side of a (via convex) and another via not the convex side. Similarly 2 ways to other side ray a . Then 4 more ways for the other side of ray b .

Problem 6.

The definition of supplementary angles is important. To quote the authors

Two convex angles that have one side in common are positioned in such a way that the second side of one angle is an extension of the second side of the other angle are called *supplementary angles*.

In schools we are usually taught that if the sum of two angles is 180° they are called supplementary angles.

1. $\angle AOC$ and $\angle COB$
2. $\angle COB$ and $\angle BOD$
3. $\angle BOD$ and $\angle DOA$
4. $\angle DOA$ and $\angle AOC$

Problem 7.

This is a good problem. We get the following:

- a) 6 straight angles (got by both sides of each line)
- b) 6 adjacent convex angles
- c) 6 convex angles formed between two rays skipping one in between

Any other skipping will form one of the three cases listed above. The figure shows the three lines.

Additionally, it is important that the lines intersect at a single point. If it did not they we would have overlapping lines and different answers to this question.

Chapter 2. Two lines and an angle

Chapter 3. Three lines

Chapter 4. Four lines. Quadrilaterals

Chapter 5. Five lines

Chapter 6. Projection from a point onto a line

Chapter 7. Dual configurations in projective geometry

Chapter 8. Desargues configuration

Chapter 9. Dual Desargues configuration

Chapter 10. Algebraic notation of “computer presentation” of configurations

Chapter 11. Polygons and n straight lines

Chapter 12. Convex polygons, convex hull of n points

Chapter 13. Solution of Exercise 3 with the help of a Desargues configuration

Chapter 14. Overview of Chapter I

Part II

Parallel Lines: A Look at Affine Geometry

Part I

Lines and Segments

Chapter 1. Parallel Straight Lines

Chapter 2. Operations available in Chapter II

Chapter 3. Properties of parallel lines

Chapter 4. Segments lying on parallel lines

Part II

Figures

Chapter 5. Parallelograms

Chapter 6. Triangles

Chapter 7. Trapezoids

Part III

Operations with Figures

Chapter 8. The Minkowsky addition of two figures

Chapter 9. Parallel projection

Chapter 10. Parallel translation

Chapter 11. Central symmetry on the plane

Chapter 12. Vectors

Chapter 13. Overview of Chapter II

Appendix for Chapter II

1. Why we cannot define equal segments in Chapter II
2. Parallel lines, equal segments, and the Desargues configuration
3. Arithmetic operations with segments
4. Segments and rational numbers
5. Affine coordinate systems on the plane

Part III

Area: A Look at Symplectic Geometry

Chapter 1. The area of a figure

Chapter 2. Area of a parallelogram

Chapter 3. Area of a triangle

Chapter 4. Area of a trapezoid

Chapter 5. Area of a polygon

Chapter 6. More problems on areas

Chapter 7. How to measure the area of a figure

Chapter 8. Overview of Chapter III

Part IV

Circles: A Look at Euclidean Geometry

Part I

Introduction to the Circle

Chapter 1. Operations available in Chapter IV

Chapter 2. Comparing segments

Chapter 3. Angles

Chapter 4. Operations with figures

Part II

**The Geometry of the Triangle and
Other Figures**

Chapter 5. Elements of triangle. Congruent triangles

Chapter 6. Construction of a triangle from its elements

Chapter 7. Relations between elements of a triangle

Chapter 8. Properties of a triangle. Particular kinds of triangles

Chapter 9. Area in Euclidean geometry

Chapter 10. The Pythagorean theorem and its applications

Chapter 11. Relations between lines and points

Chapter 12. Special lines and special points in a triangle

Chapter 13. Polygons

Chapter 14. Summary of facts about different quadrilaterals

Chapter 15. Similarity

Part III

Circles

Chapter 16. Circles and points

Chapter 17. Circles and lines

Chapter 18. Two or more circles

Chapter 19. Circles and angles

Chapter 20. A circle and a triangle

Chapter 21. Circles and polygons

Chapter 22. Circumference and arc

Chapter 23. Disks and sectors

Chapter 24. Overview of Chapter IV
